

Introducing FleetResolve: The Agentic Operations Platform for Fleet Management

Agentic fleet management shifts human expertise to solving high-impact problems

1 TODAY

Maya spends her day finding, sorting, and reading problems.

Maya spends her day finding, sorting, and reading problems.

2 FLEETRESOLVE + MAYA

AI Agent works by her side, so Maya spends her time resolving problems.

Maya spends her time resolving problems, not finding them.

Sunnyvale, CA - August 2026 – FleetResolve today introduced an agentic operations platform designed to expedite the resolution of critical issues in fleet management. The solution aims at reducing the cost of running the fleet by 30 – 40% ([Source: Deloitte Truck Fleet](#))

Today, connected fleets are generating more issues and operational context than operators can efficiently investigate one at a time. Expert operators spend valuable time searching across systems, prioritizing issues, and routing work.

FleetResolve changes the operating model with an AI agent that investigates issues, synthesizes evidence, prioritizes work, recommends the next action, and routes each issue to the human best positioned to resolve it. The agent removes repetitive triage and assignment work so operators can focus their expertise on the issues that require human judgment.

At the start of her shift, Maya opens FleetResolve and sees a prioritized queue of issues matched to her expertise, capacity, and authorization. Each issue includes why it matters, the evidence behind it, and the recommended next action. For issues requiring specialized expertise or approval, FleetResolve routes them directly to the appropriate expert with the evidence needed for handoff. Maya doesn't receive every problem. She receives the problems she is best positioned to solve.

FleetResolve changes the economics of fleet operations by turning operator time from triage into resolution. It reduces time-to-assignment and MTTR, focuses scarce human expertise on high-value work, and enables fleet operations to scale across new devices, services, and organizations without requiring custom decision and workflow logic to grow at the same rate.

Frequently Asked Questions

I. Business Opportunity

Q1. Why does FleetResolve need AI?

A. Fleet operations increasingly involve issues that require investigation across multiple sources of changing information. It is difficult to enumerate every possible combination of device state, incident history, operational knowledge, impact, urgency, recommended action, and available expertise as deterministic rules.

AI solves this by acting as the investigation layer. Instead of encoding every possible investigation path as a fixed workflow, FleetResolve allows the agent to determine what information it needs, which tools to call, and what to investigate next based on what it has already observed.

Q2. Why not simply add more deterministic rules?

A. More rules can identify more known conditions, but they also increase the complexity of maintaining every possible investigation path.

As the fleet scales through new device families, acquired businesses, service organizations, and new troubleshooting teams, traditional automation can require additional APIs, data mappings, workflows, rules, and routing logic for each new domain.

FleetResolve uses deterministic automation where rules are appropriate and agentic reasoning where the work requires synthesizing evidence and context. When a new device or service domain is added, the goal is to extend the agent's access to the relevant data, knowledge, tools, and people, rather than encode every new investigation path as a custom workflow.

This does not eliminate integration. Systems still need appropriate APIs, permissions, data access, and tool definitions. The goal is to reduce the amount of decision and workflow logic that must be created and maintained as the operational environment grows.

Use deterministic automation for what can be defined. Use agentic reasoning for what cannot practically be enumerated.

Q3. Why now?

A. Agentic AI now provides a way to investigate across changing context while deterministic policy and guardrails maintain control. This creates an opportunity to move beyond rule-based issue detection toward intelligent triage and resolution routing as fleet complexity increases.

Q4. What does the operator experience look like?

A. Maya's experience will improve in the following ways:

1. Maya will receive only the issues she is best positioned to solve.
2. Instead of Maya having to search across systems to reconstruct an issue, the agent would have already synthesized the information for her and proposed a recommended next action. So Maya's role shifts from doing repetitive manual work to work that requires her specialized expertise.

Q5. What metrics define success?

A. FleetResolve's primary measure of success is Mean Time to Resolution (MTTR): how quickly a fleet issue moves from detection to resolution. Time-to-assignment, high-priority response time, and correct first-time routing measure whether FleetResolve is getting the right work to the right human faster.

FleetResolve also measures the quality and safety of the agent's recommendations through unsupported recommendation rate, unauthorized action rate, and human escalation rate. As the fleet grows, we measure whether new device families, service organizations, and operational domains can be onboarded without a proportional increase in custom workflows and integration effort.
